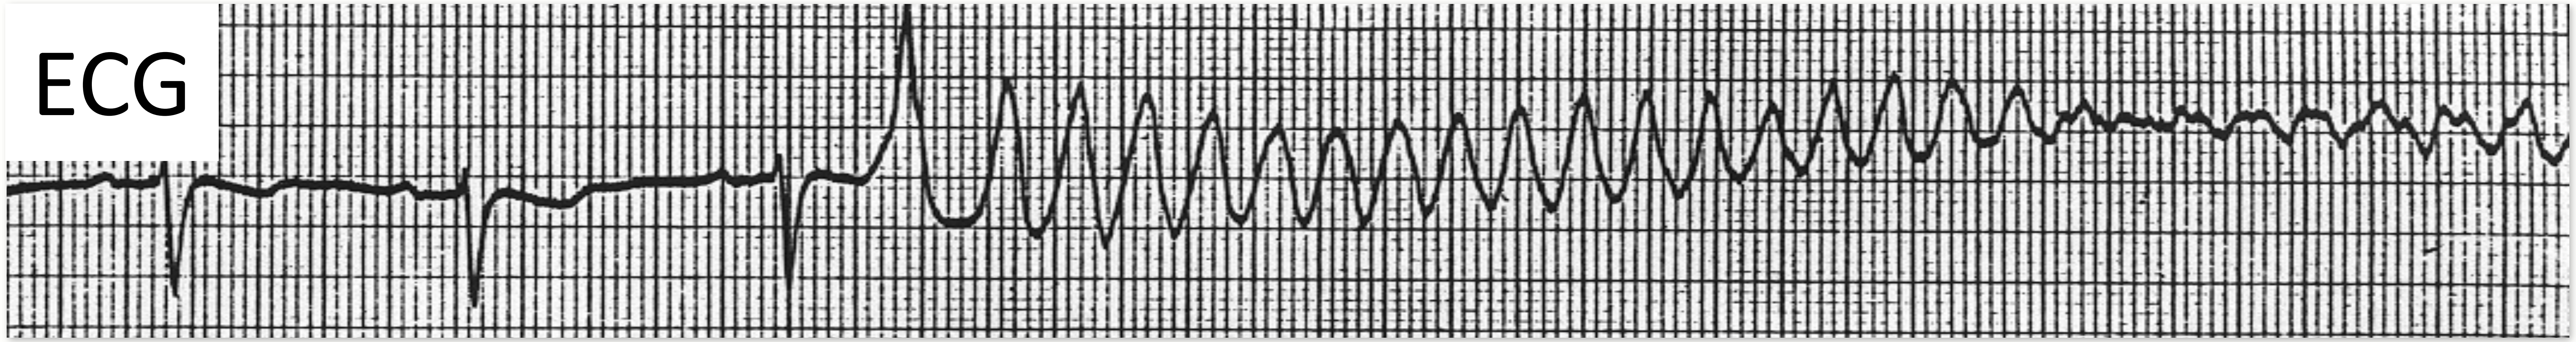
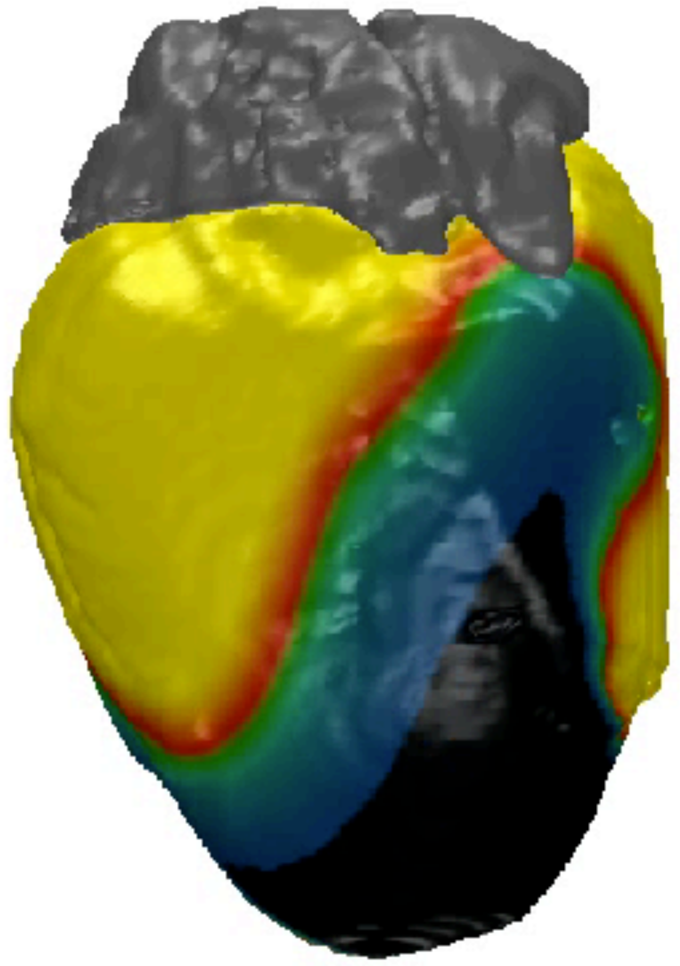
Transitions to Cardiac Arrhythmias

Normal Rhythm → Tachycardia → Fibrillation

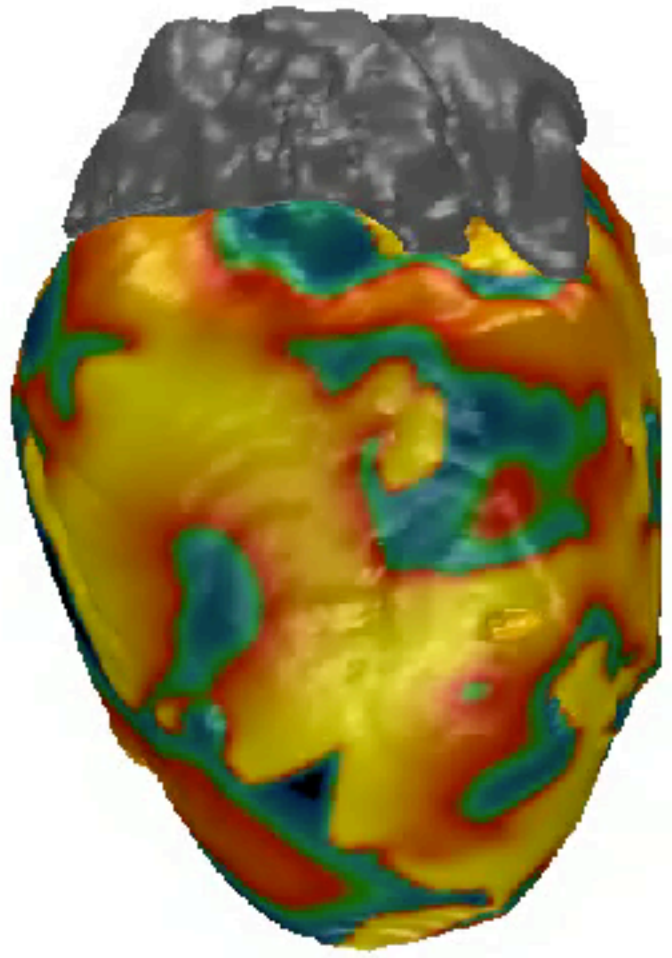


electrical excitation waves

plane waves



spiral waves



chaos

simulations: P. Bittihn

Outline

- the heart - a network of electrically and mechanically coupled contracting cardiac cells
- excitable media, (chaotic) spiral waves, and phase singularities
- virtual electrodes and low-energy defibrillation
- (transient) chaos and complexity in cardiac arrhythmias

The Heart

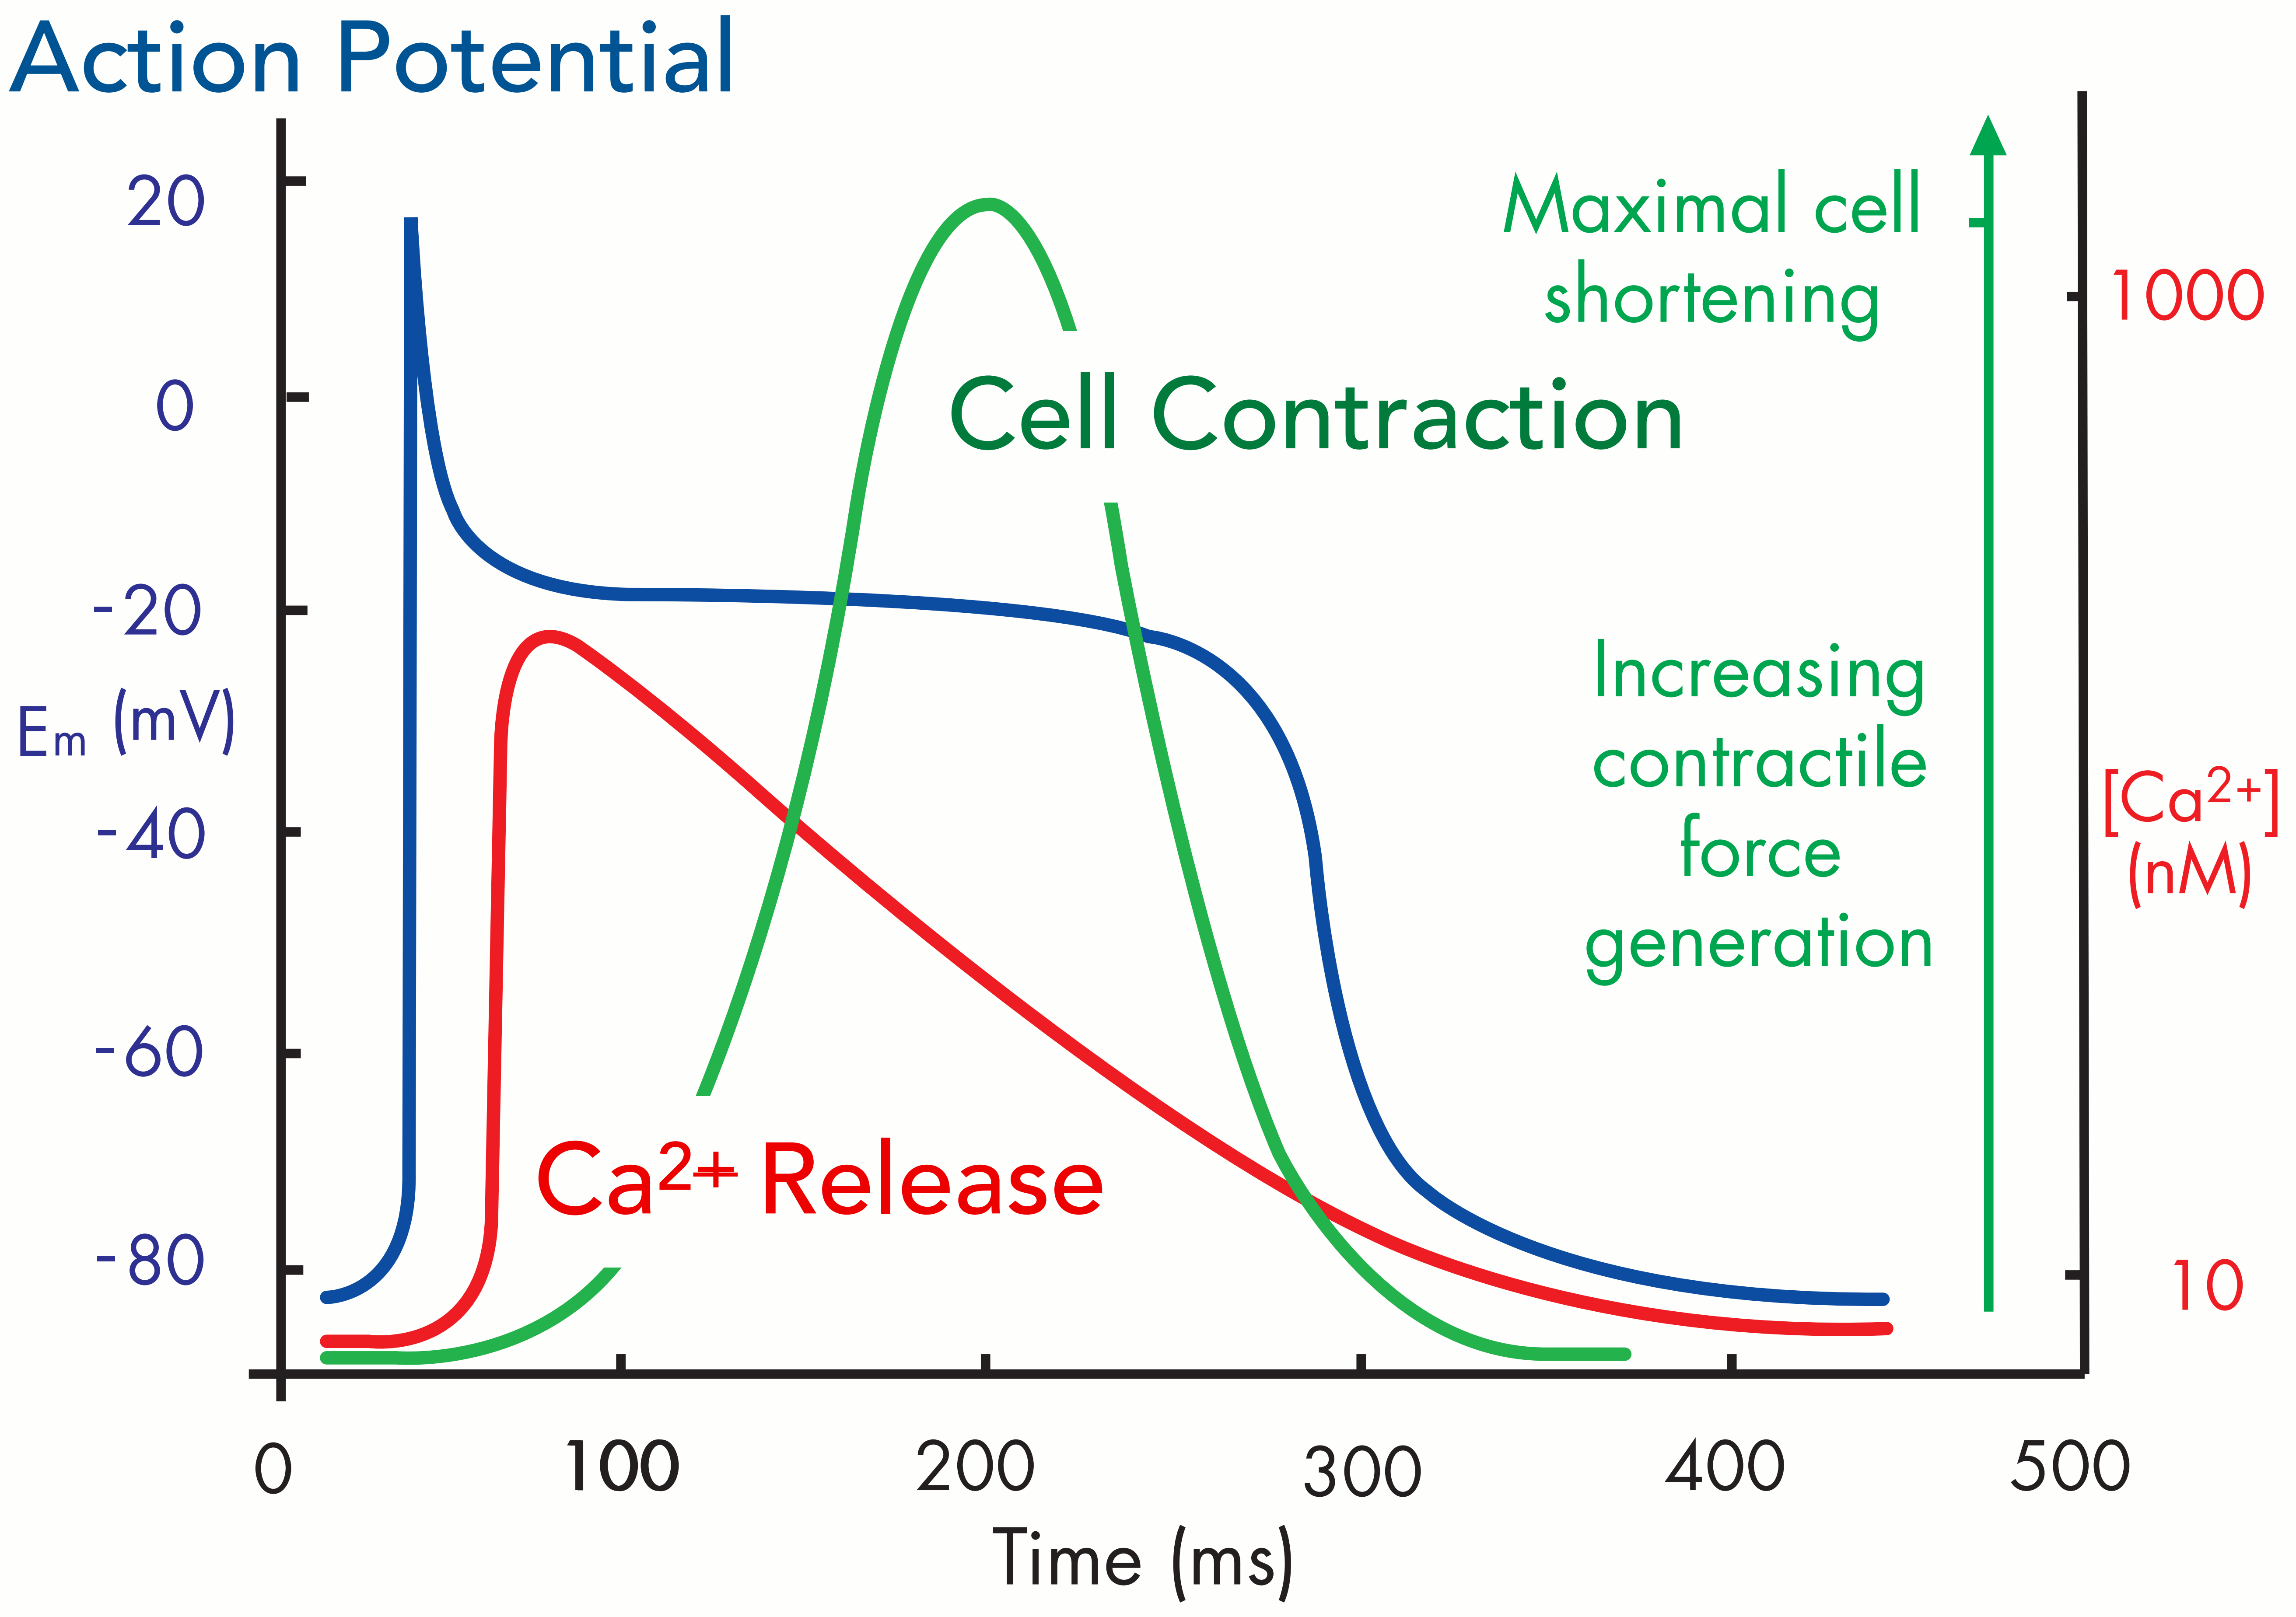
Excitation-Contraction Coupling



from: M. Scoote et al., *Heart* 89, 371–376 (2003)

electrical excitation

mechanical contraction

Mechanical perturbation induces electrical stimulation via stretch activated ion channels.

Mathematical Models of Cardiac Dynamics

continuum models averaging electrical behaviour of many cells

detailed ionic models: e.g., Luo-Rudy-II (15), Majahan (27), Bondarenko (44), …

membrane voltage

$$\frac{\partial V_m}{\partial t} = \nabla \cdot \underline{\mathbf{D}} \nabla V_m - I_{\text{ion}}(V_m, \mathbf{h})/C_m$$

$$\frac{\partial \mathbf{h}}{\partial t} = \mathbf{H}(V_m, \mathbf{h})$$

ionic currents

$$I_{\text{ion}}(V_m, \mathbf{h}) = \sum_x I_x(V_m, \mathbf{h}) + I_{\text{injection}}$$

local cell dynamics (15-30 variables, 150 - 300 parameters!)

generic qualitative models: e.g., Fenton-Karma (3), Beeler-Reuter (8), …

simple qualitative models: e.g., Barkley (2), FitzHugh-Nagumo (2), Aliev-Panfilov (2), …

see Scholarpedia article by F. Fenton and E. Cherry discussing 45 models of cardiac cells

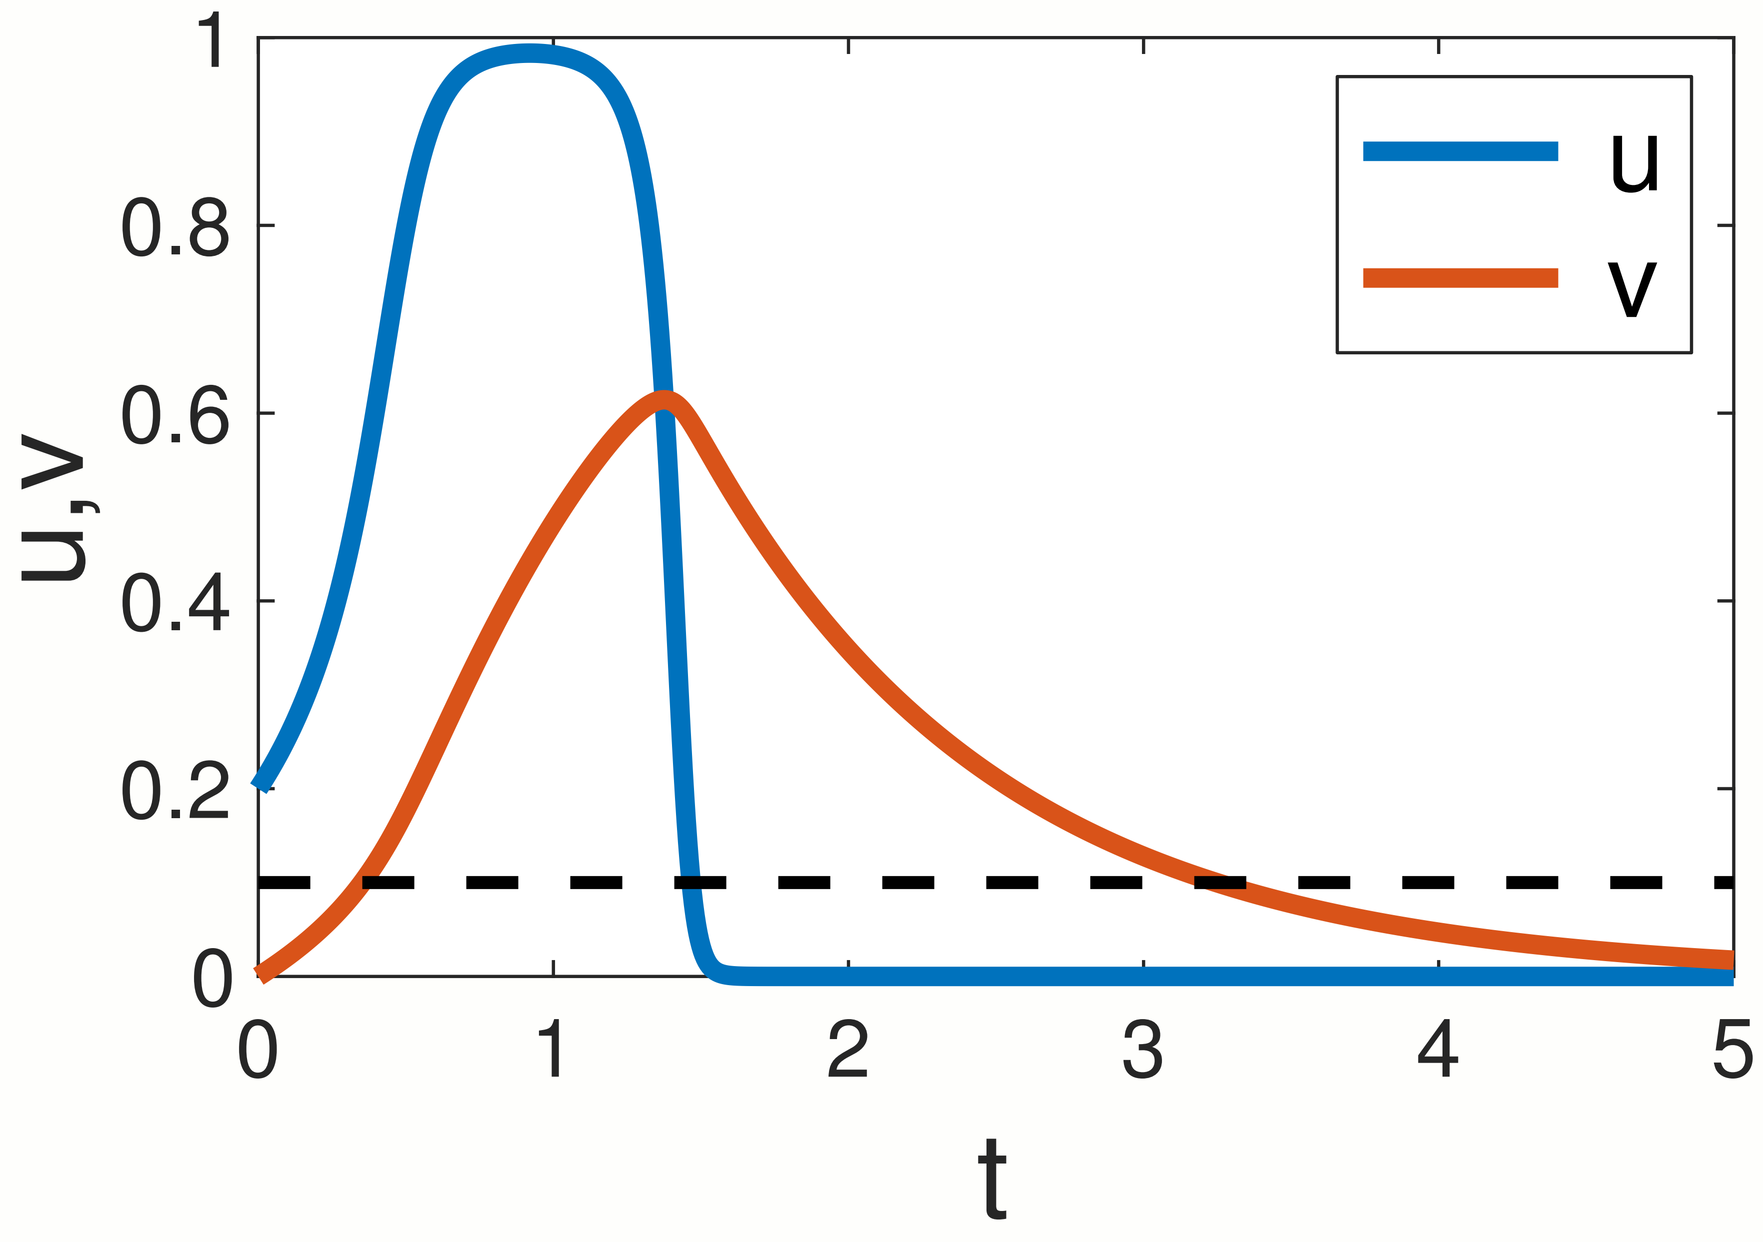
Simple generic system: The Barkley model

$$\frac{\partial u}{\partial t} = \frac{1}{\varepsilon} u(1-u)\,(u-u_{th}) \qquad u_{th} = \frac{v+b}{a}$$

excitability threshold

$$\frac{\partial v}{\partial t} = u - v$$

controls excitability threshold



$1/\epsilon$ time scale of the fast variable u

a measure for action potential duration

b/a measure for excitation threshold

The Barkley model

local dynamics diffusive coupling

$$\frac{\partial u}{\partial t} = \frac{1}{\varepsilon} u(1-u)\,(u-u_{th}) + D \cdot \nabla^2 u$$

$$\frac{\partial v}{\partial t} = u - v$$

with: $u_{th} = \dfrac{v+b}{a}$

$1/\epsilon$ time scale of the fast variable u

a measure for action potential duration

b/a measure for excitation threshold

D. Barkley et al., Phys. Rev. A 4, 2489 (1990)
D. Barkley, Physica D 49, 6170 (1991)

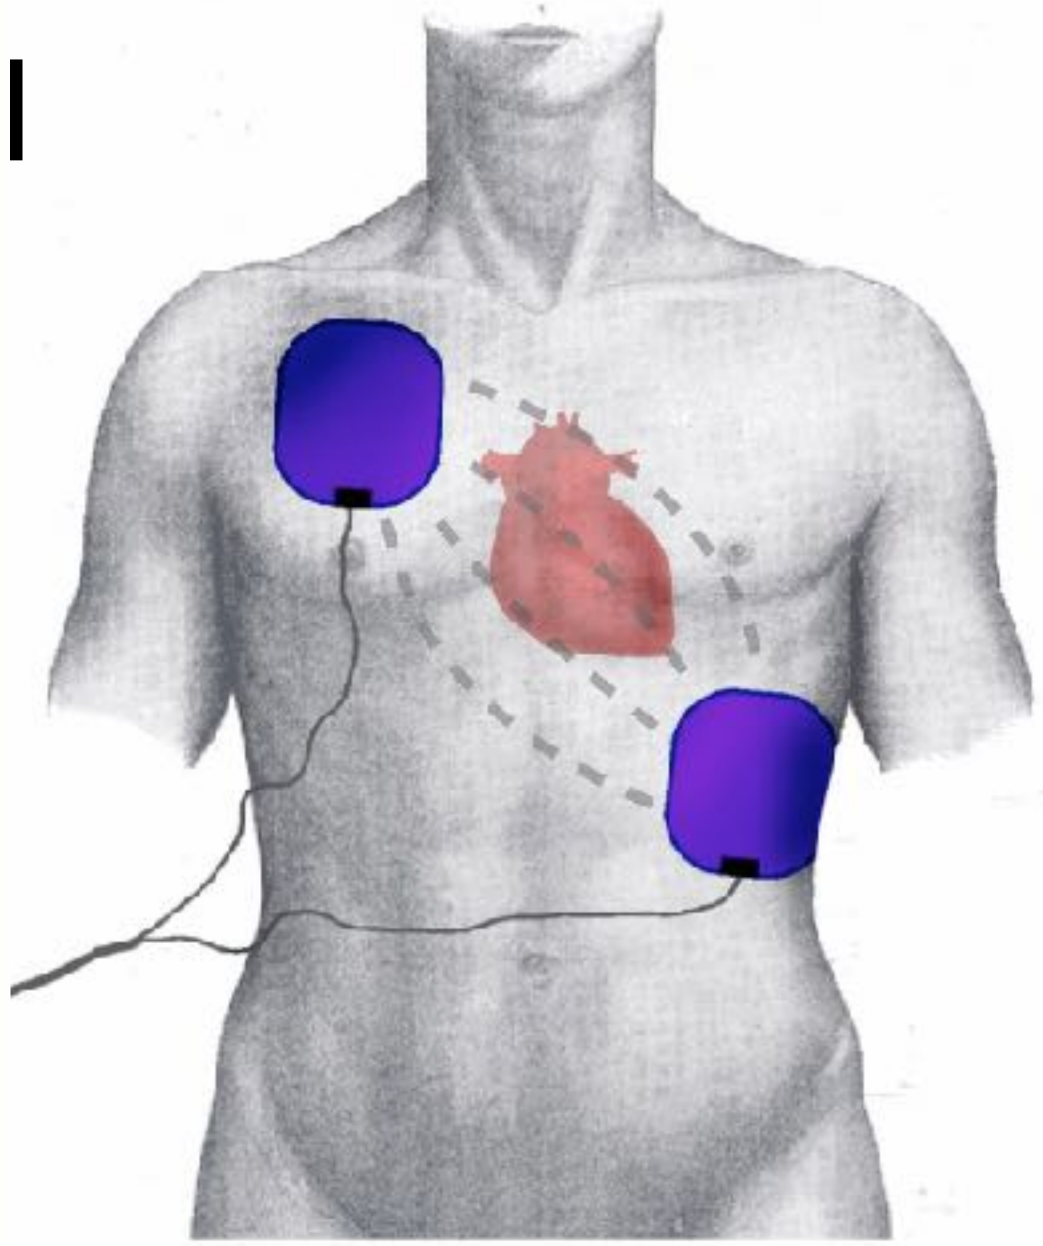
Terminating Cardiac Arrhythmias

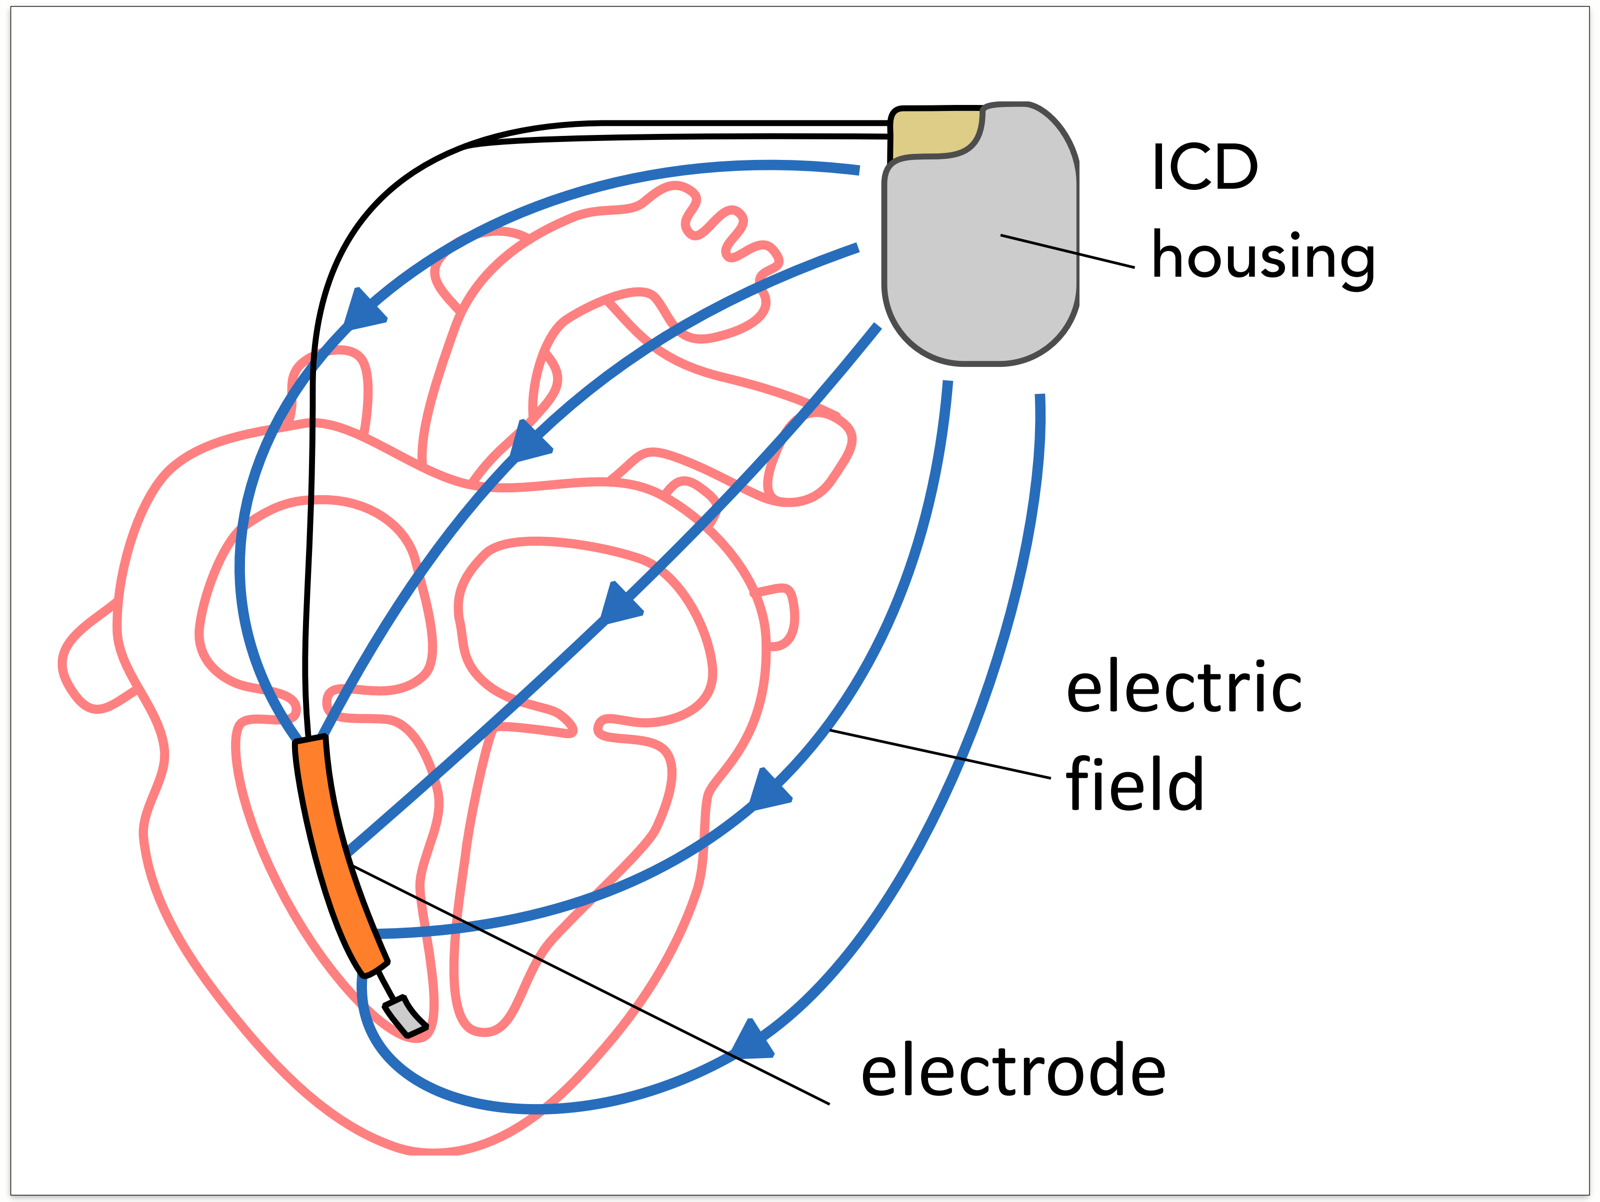
Defibrillation

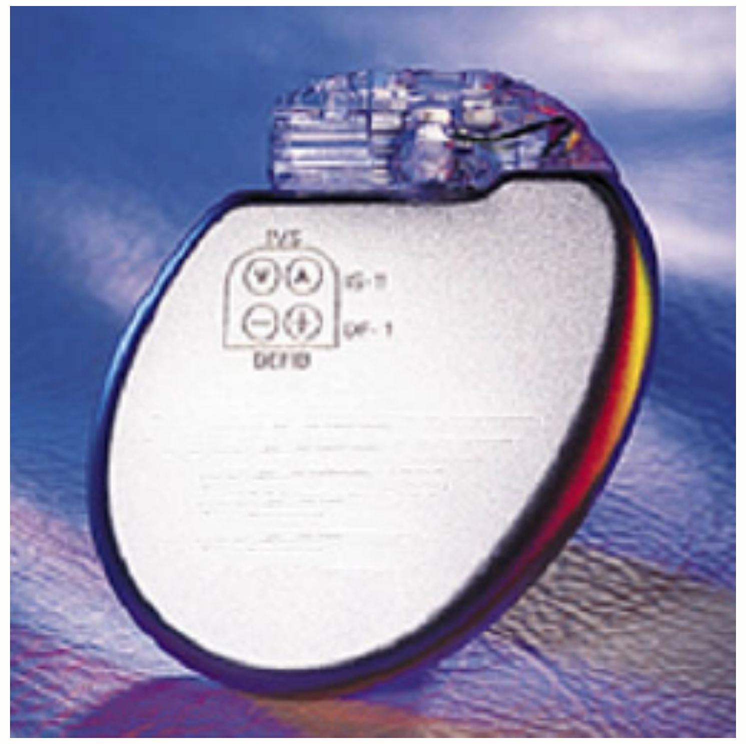
Principle: Reset electrical activity of all cells by synchronous excitation

external



internal





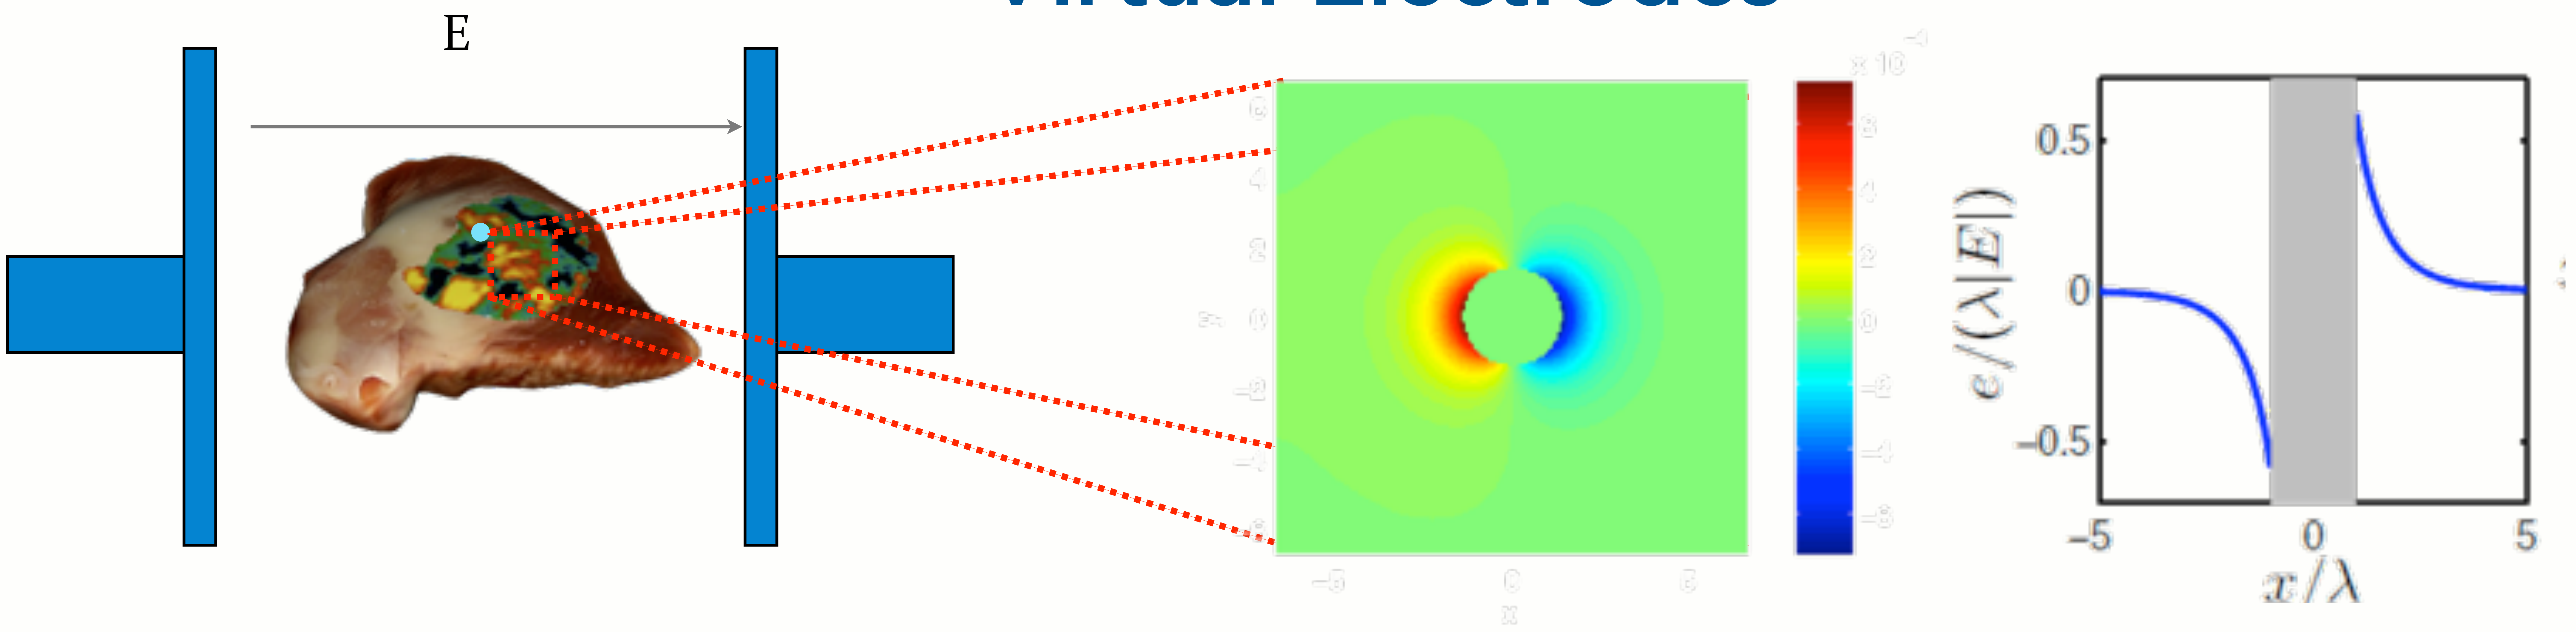
Electric shocks: energy 360J (external) 40 J (internal) 1000 V 30 A 12 ms

Severe side effects: tissue damage - traumatic pain

G.P. Walcott et al., Resuscitation 59, 59-70 (2003)

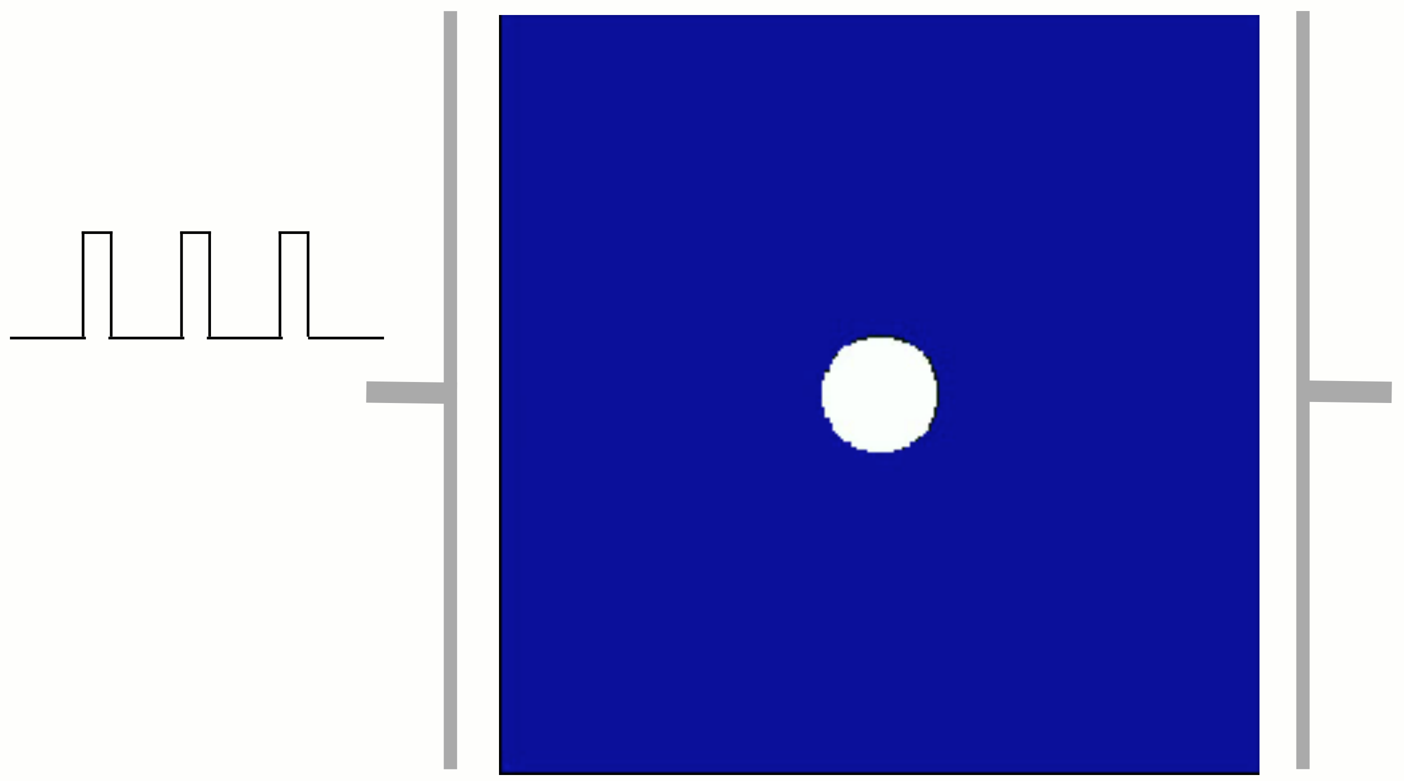
Terminating Cardiac Arrhythmias

Virtual Electrodes



Blood vessels, scars, fatty tissue

- are obstacles to electrical conduction
- may act as virtual electrodes



Super-threshold depolarization leads to wave emission if a short rectangular electric field pulse is applied.

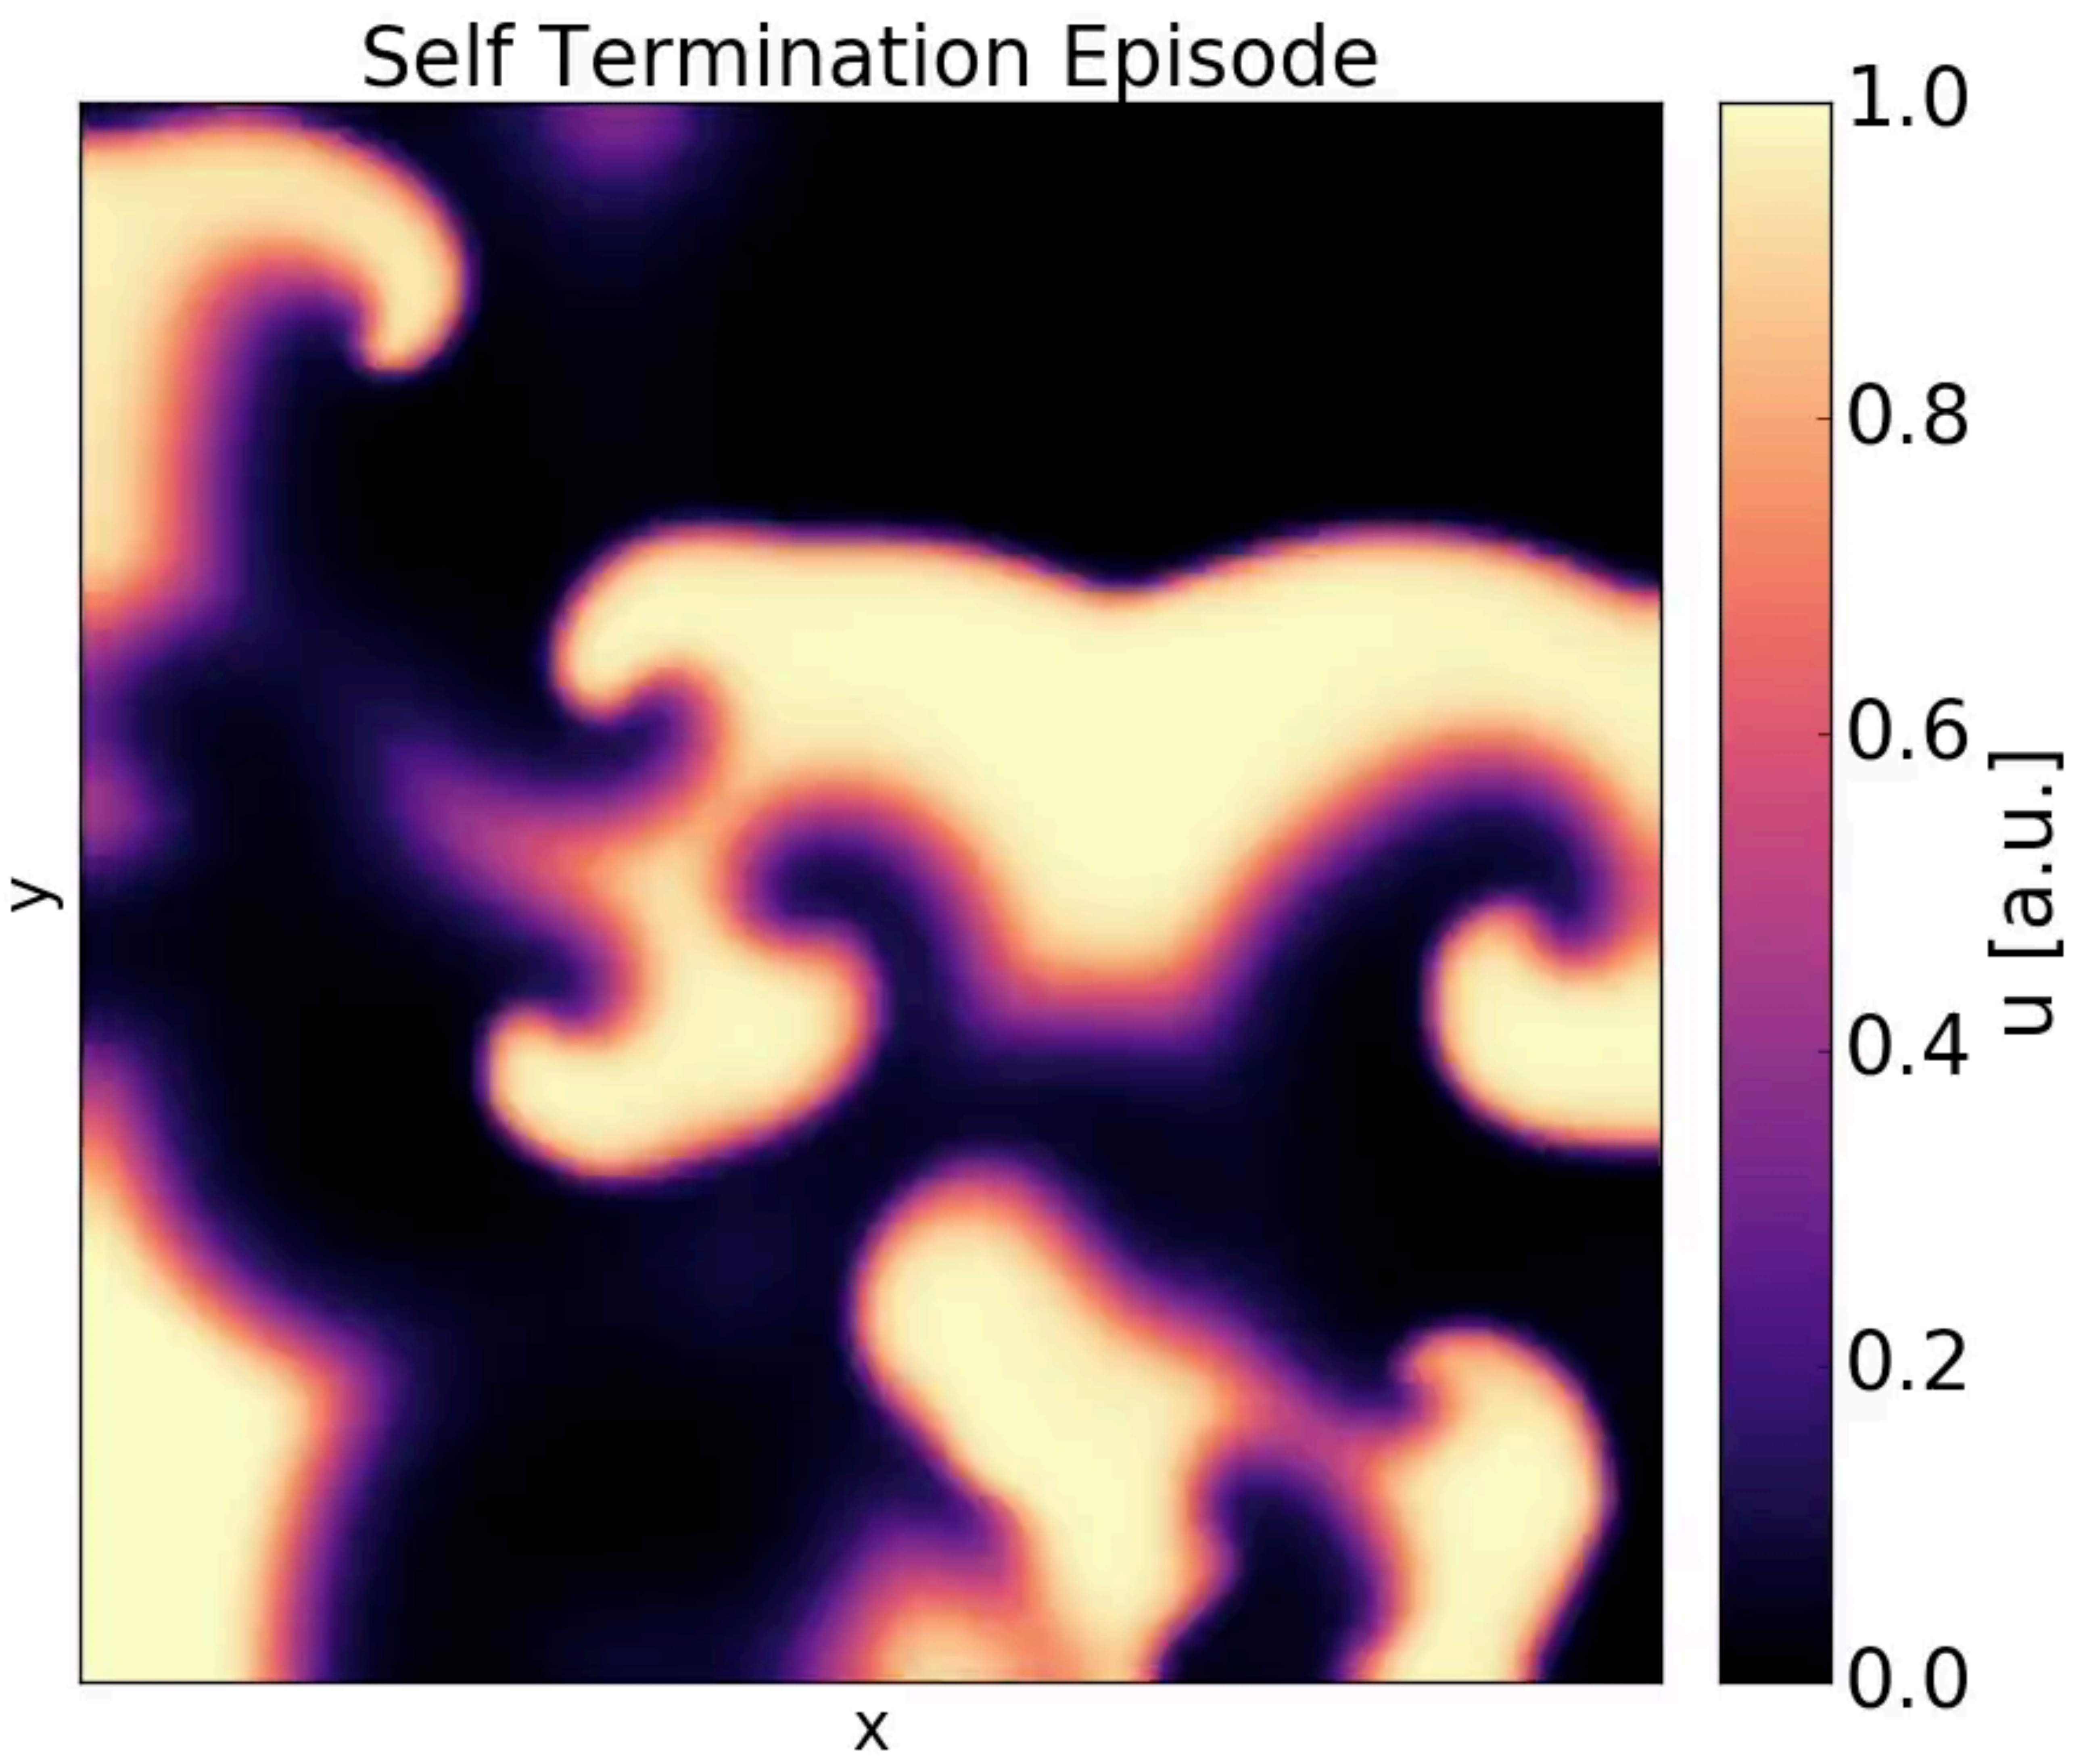
Simulation using the Fenton-Karma model

$$\frac{\partial u}{\partial t} = \nabla \cdot \underline{\mathbf{D}} \nabla u - I_{Ion}(u, \mathbf{h})/C_m$$

$$\frac{\partial \mathbf{h}}{\partial t} = \mathbf{g}(u, \mathbf{h})$$

gating variables $\mathbf{h} = (v, w)$

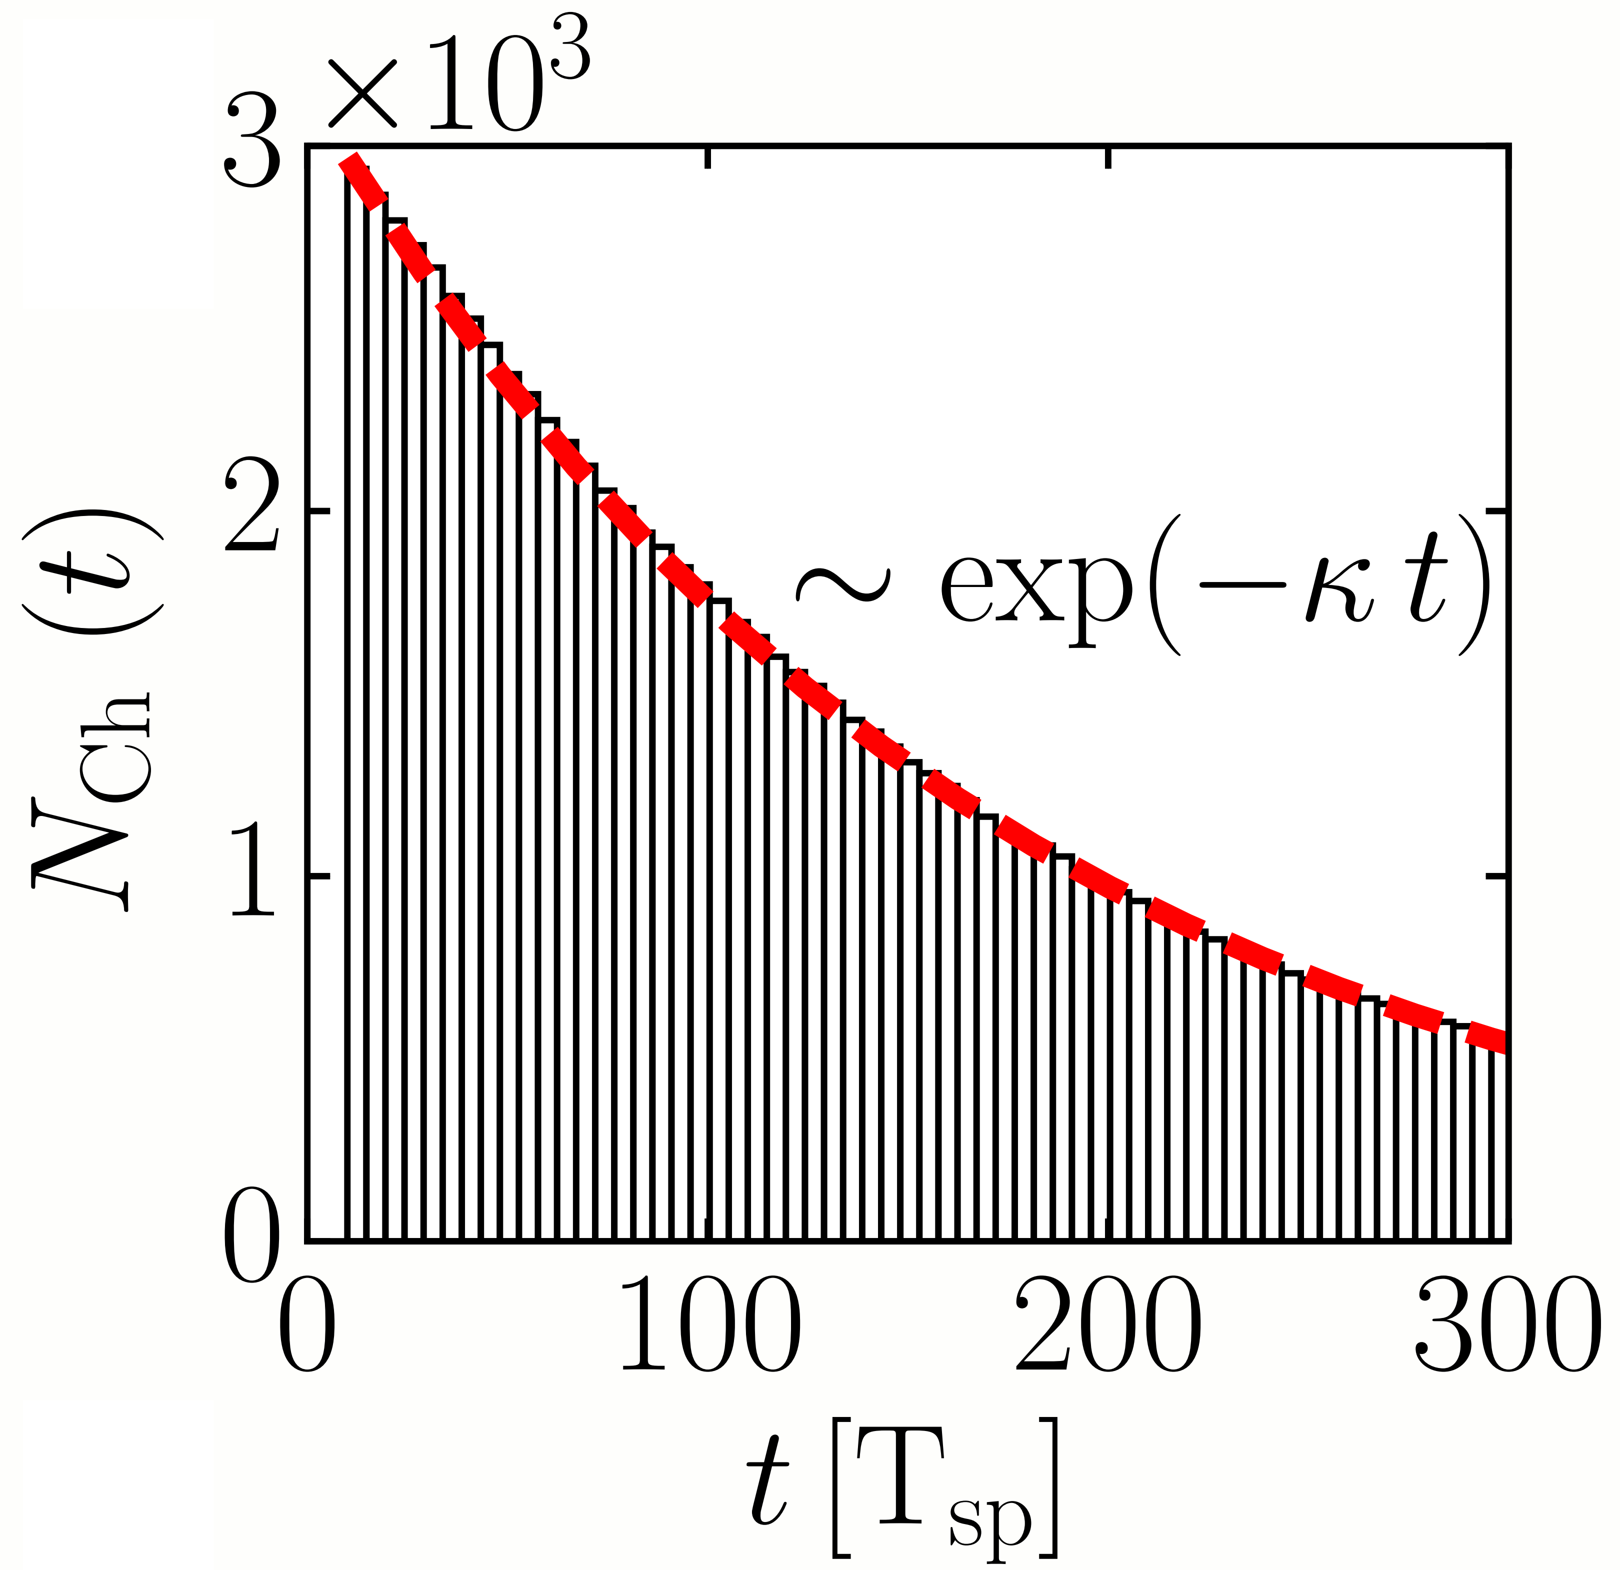


T. Lilienkamp and U. Parlitz, Phys. Rev. Lett. 120, 094101 (2018)

Chaotic transients and the average lifetime in 2D simulations

Fenton-Karma model   3000 initial conditions

fraction of trajectories still showing chaotic dynamics at time t



$$N_{Ch}(t) \sim \exp(-\kappa t)$$

escape rate κ

quantifies how fast trajectories from random initial conditions escape the chaotic saddle and reach the final (non-chaotic) state

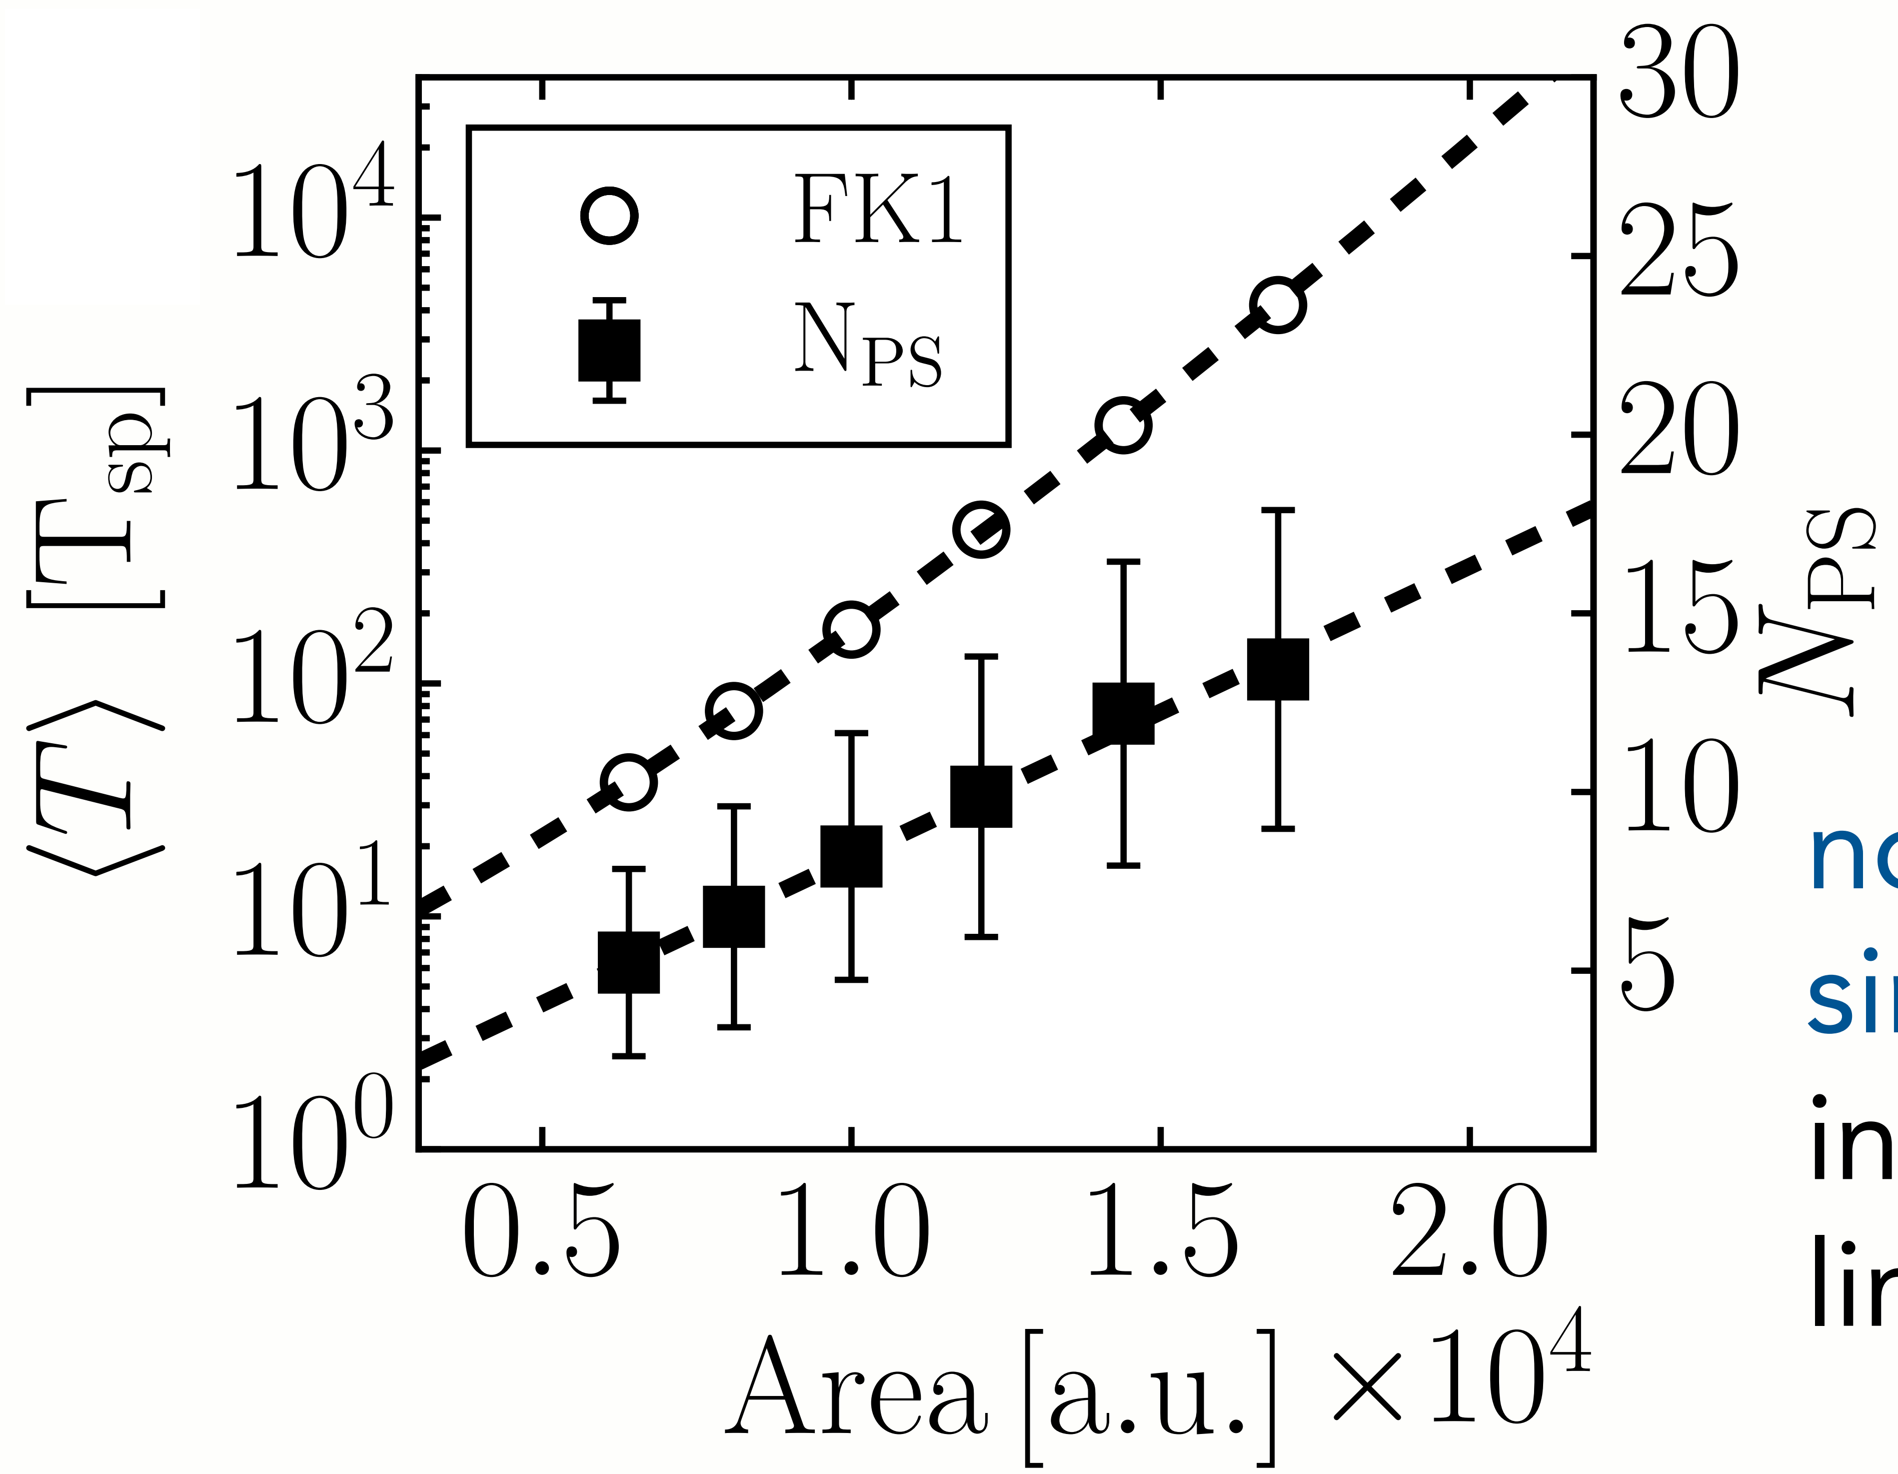
$\langle T \rangle \approx \frac{1}{\kappa}$ **average transient lifetime**

T. Lilienkamp et al., Phys. Rev. Lett. 119, 054101 (2017)

Chaotic transients and the average lifetime in 2D simulations

$\langle T \rangle \approx \frac{1}{\kappa}$ **average transient lifetime**

increases exponentially with system size



no. of phase singularities increases linearly

- Larger heart muscle volumes increase the risk of cardiac arrhythmias and related morbidity and mortality.
  → due to longer transients and more phase singularities (??)

- Impact of (finite) pertubations changes during some period of time prior to the end of the transient.
  → precursors for end of arrhythmia (??)

T. Lilienkamp and U. Parlitz,
Phys. Rev. Lett. 120, 094101 (2018),
Phys. Rev. E 98, 022215 (2018)

Summary

The heart

- consists of a network of electrically and mechanically coupled excitable elements
- forming an excitable medium that supports plane waves, spiral waves, and
- (life-threatening) **spatio-temporal chaos** (e.g., ventricular fibrillation)
- that can be transient and exhibits complexity fluctuations and
- provides an ambitious target for (low-energy) control methods (defibrillation)

Outlook: Interaction with other organs, in particular heart & brain
